

shipperform a simpler way to manage your cargo worldwide

Shipperform project aims to develop a platform to facilitate and make the process of shippers management, freight transport more efficient, in an automatic and less expensive way, ensuring a better service to the same cargo buyers, controlling its own inter-modal process. This product will allow shippers to compare quotes, manage schedules and provide information to customers about the current stage of the cargo, tracking it, being a totally innovative feature.

In a more specific way, this project will result in a technical advance on the state of the art of the company at national and/or international level, given that most of the solutions provided by MAEIL competitors are, nowadays, focused only on a market approach, in other words, they have as nuclear service connecting shippers and shipowners on a public platform. The goal in Shipperform is to go further and turn to shippers, helping them manage all the exporting process in a more consistent and validated manner.

Objectives

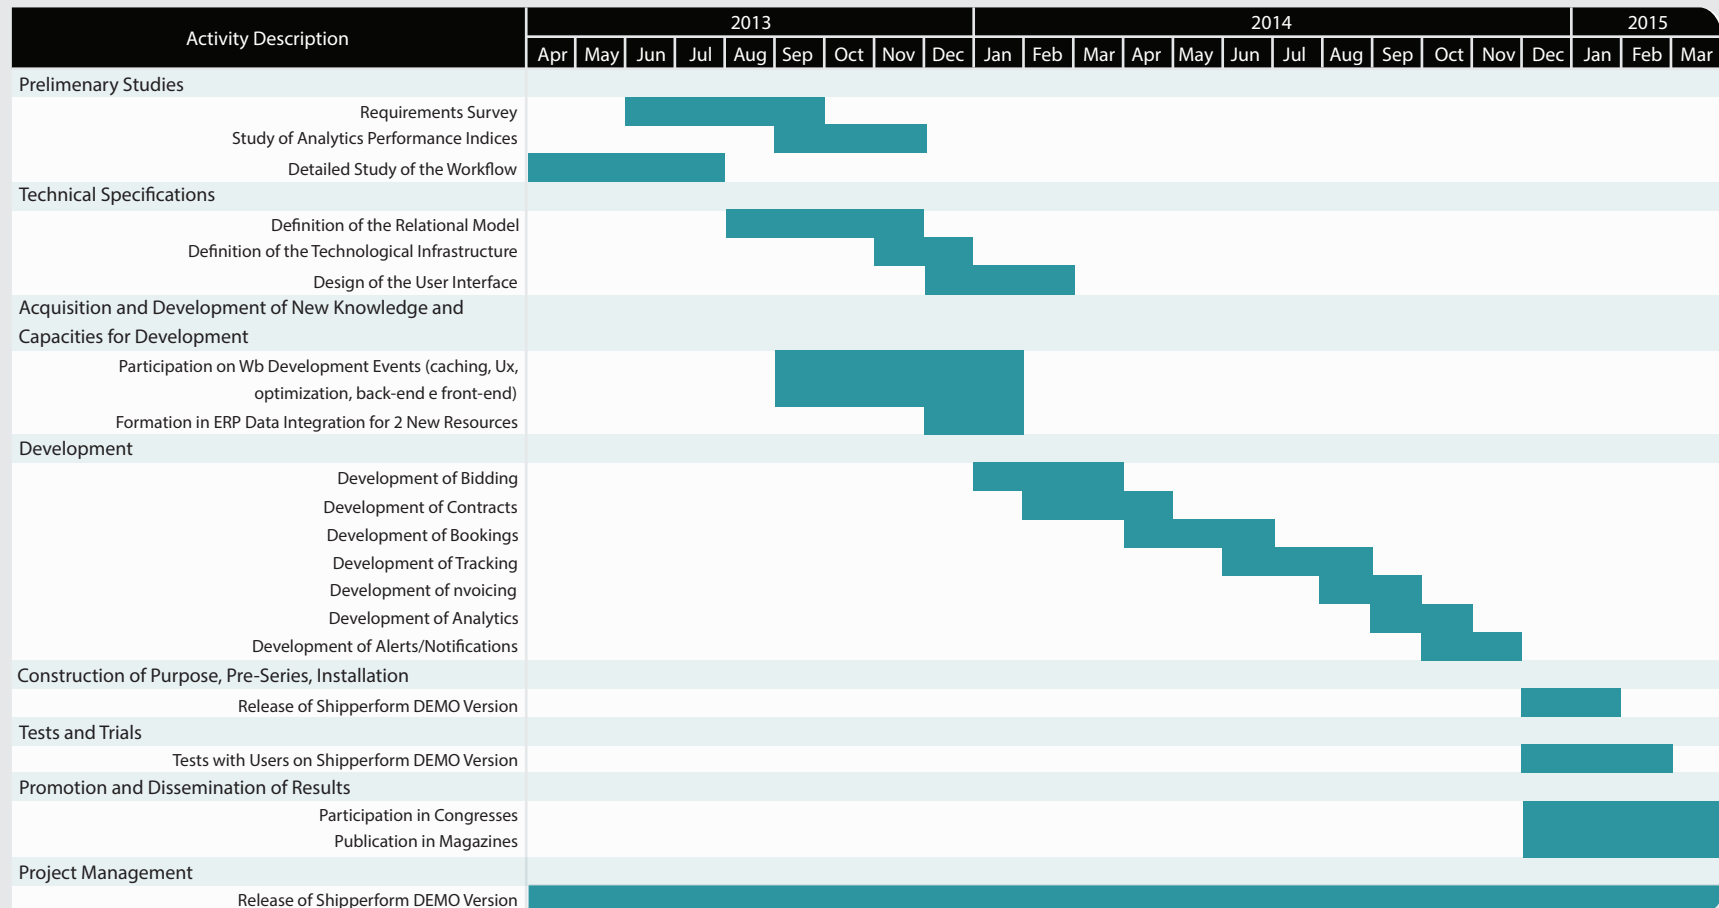

The Shipperform will work as a Software as a Service, serving in the cloud, managing the entire logistics process, available on the web and mobile environment. This will facilitate alone, the penetration of this solution into the global market. In a summarized way, the objectives of Shipperform project and the goals to be met are:

- 1 Create a global platform for the management on the entire exporting process;
- 2 Centralize all information resulting from the exporting process of containerized cargo;
- 3 Increase the use of ICT on the Workflow port on a internacional level;
- 4 Define and implement Business Intelligence tools to better evaluate the process and its partners;
- 5 Create a platform to manage large volumes of information from different sources and with different needs;
- 6 Create a platform for the workflow management of exporting transactions as SaaS;
- 7 Reduce the operating cost of an export transaction.
